

# Uni-I/O™ Instruction

## Firmware (BIN) 1.32 or higher

This Uni-I/O™ module is supported by **Firmware (BIN) version 1.32 or higher**, released with UniLogic 1.32.

If you connect this unit to a UniStream controller with a Firmware version lower than 1.32 the following will occur:

- The system will not function. All UniStream I/O modules connected to the controller will not function.
- The I/O LEDs will blink, and the HMI may display the Uni-I/O Error.

## Course of Action

### New Applications

You do not need to take any special steps—simply download your application using UniLogic 1.32.00 or higher.

UniLogic checks to see if the firmware in the controller is compatible with the UniLogic version and notifies you if an update is required.

### Existing Applications

If these modules are used with a UniStream that is running an earlier version, you must update the controller OS.

Failing to do so will prevent Uni-I/O™ - UniStream communication. The simplest way is to open the existing application in UniLogic 1.32.00 or higher, and download it to your controller, following the OS update instructions.

You can also update the firmware using a DOK (USB Memory Stick), as explained in the UniLogic Help topic 'Firmware'.
