UniStream[™] Uni-I/O[™] Modules ^{Technical Specifications} UIS-WCB2

This guide provides specifications for Unitronics' Uni-I/O[™] Wide module UIS-WCB2. This module comprises:

- 10 Digital inputs, 24VDC, sink/source, including 2 High speed counter input channels ^{(1) (2)}
- 2 x Analog inputs, 0÷10V / 0÷20mA, 14 bits
- 2 x Temperature inputs, RTD / Thermocouple
- 8 x Transistor outputs, source
- 2 x Transistor outputs, sink
 - including 2 High speed PWM output channels (1) (3)
- 2 x Analog outputs, 0÷10V / -10÷10V / 0÷20mA / 4÷20mA, 13/14 bits

Uni-I/O Wide modules are compatible with UniStream[™] Programmable Logic Controllers. They may be either snapped onto the back of a UniStream[™] HMI Panel next to a CPU-for-Panel to create an all-inone PLC + HMI controller, or installed on a standard DIN Rail using a Local Expansion Adapter.

Installation Guides are available in the Unitronics Technical Library at <u>www.unitronics.com</u>.

Power Supply	
Nominal operating voltage	24VDC
Operating voltage	20.4 – 28.8VDC
Maximum current consumption	180mA@24VDC
Isolation	None

Digital Inputs	
Number of inputs	10
Туре	Sink or Source
Isolation voltage	
Input to bus	500VAC for 1 minute
Input to input	None
Input to power supply	500VAC for 1 minute
Nominal voltage	24VDC @ 6mA
Input voltage	
Sink/Source	On state: 15-30VDC, 4mA min.
	Off state: 0-5VDC, 1mA max.
Nominal impedance	4kΩ
Filter	Settable between 1 to 32ms
High speed inputs ^{(1) (2)}	
Frequency / Period	Pulse/Direction mode: 10kHz max. / 100μ s min.
	$(t_p \text{ in the Pulse/Dir Mode figure below)}$
	(t _p in the Quadrature Mode figure below)
Pulse width	$40\mu s$ min. for each state (t_w in the figures below)
Cable	Shielded twisted pair

Notes

- 1. The UIS-WCB1 utilizes two high speed blocks that can each be assigned either to the inputs or to the outputs.
- 2. Four of the digital inputs may be configured to function either as normal, or as high speed digital inputs, that can receive high speed pulse signals from up to two sensors or shaft encoders.
- 3. The two transistor outputs may be configured to function either as normal, or as high speed PWM outputs.
- 4. The 4-20mA input option is implemented using 0-20mA input range.
- 5. The UIS-WCB1 analog inputs measure values that are slightly higher than the nominal input range (Input Over-range).

Note that when the input overflow occurs, it is indicated in the corresponding I/O Status tag while the input value is registered as the maximum permissible value. For example, if the specified input

range is $0 \div 10V$, the Over-range values can reach up to 10.15V, and any input voltage higher than that will still register as 10.15V while the Overflow system tag is turned on.

- 6. See LED Indications Table for description of the relevant indications. Note that the diagnostics results are also indicated in the system tags and can be observed through the UniApps[™] or the online state of the UniLogic[™].
- 7. Step response and update time are independent of the number of channels that are used.
- 8. The UIS-WCB1 inherently supports 3-wire sensors.

4-wire sensors may be connected by utilizing 3 of the sensor wires; in-order to achieve the specified performance, all sensor wires shall be of identical type and length just as with a 3-wire sensor connection.

2-wire sensors may also be connected; performance in this case will degrade because of the wires` resistance.

Refer to the UIS-WCB1 installation guide for detailed installation instructions.

9. The UIS-WCB1 temperature inputs measure values that are slightly higher or lower than the nominal input range (Input Over/Under-range respectively).

Note that when input Overflow, Underflow or a connection fault occurs, it is indicated in the corresponding I/O Status tag (refer to the UniLogic[™] help for details) as well as by the respective input LED (see LED Indications), while the input value is registered as follows:

Fault Type	Registered Value in the Input Tag
Overflow	32,767
Underflow	-32,767
Connection fault	-32,768

- 10. For temperature measurement, the value is represented in 0.1° units. For example, a temperature of 12.3° is represented as 123 at the Value tag.
- 11. The overall accuracy for thermocouples is a combination of the per-sensor specified accuracy and the thermocouple cold junction error specification.

The module requires at least 30 minutes of warm-up in order to meet the accuracy specifications.

12. Sensor connection fault check is active by default for temperature, resistance and mV measurements. This may interfere with some test equipment like RTD, thermocouple, resistance and voltage simulators and thus may induce reading errors or cause malfunction of the test equipment and/or the UIS-WCB1.

In order to interoperate correctly with such equipment, you may set the Disable Fault Detection I/O tag. This will disable connection fault check for all inputs.

Note that when this tag is set, the UIS-WCB1 will not check, or report, connection faults; thus, the reading in such case is unpredictable.

- 13. Life expectancy of the relay contacts depends on the application that they are used in. The product's installation guide provides procedures for using the contacts with long cables or with inductive loads.
- 14. The UIS-WCB1 analog outputs are able to output values that are slightly higher or lower (if applicable) than the nominal output range (Output Over/Under-range respectively).
